**COURSE DETAILS**

**Course Code:** F70CF  
**Full Course Title:** Continuous-Time Finance  
**SCQF Level:** 10  
**SCAF Credits:** 15  
**Available as Elective:** No

**DELIVERY LEVEL**

**Additional Information:**

**COURSE AIMS**

This course develops the theory and practice of financial derivatives pricing in continuous time

**LEARNING OUTCOMES – SUBJECT MASTERY**

At the end of studying this course, students should be able to:

- Demonstrate a knowledge of Brownian motion and its properties;
- Show how to calibrate the Binomial model as an approximation to Brownian motion using empirical data;
- Apply Ito's Formula, the Girsanov theorem and the martingale representation theorem;
- Work with martingale measures, and understand their connection with arbitrage free/complete markets;
- Understand the concepts of replication, hedging, and delta hedging in continuous time;
- Derive the Black-Scholes formula and the Black-Scholes PDE;
- Price contingent claims (in particular European style options and forward contracts);
- Extend the Black-Scholes formula to foreign currencies and dividend paying stocks;
- Understand the role of the Greeks in portfolio risk management;
- Derive relationships between forward interest rates, spot rates and zero coupon bond prices;
F70CF Continuous-Time Finance

- Understand issues involved in selecting and using short rate models for pricing bonds and bond derivatives;
- Manipulate explicit bond price formulae for the Vasicek and CIR models, and derive the implied forward rate curves;
- Define the different approaches to modelling credit risk
- Define and apply the Merton model for credit risk to price simple corporate bonds and calculate credit spreads
- Define and apply the 2-state model for credit risk with deterministic and stochastic transition intensities.

LEARNING OUTCOMES – PERSONAL ABILITIES

- Demonstrate the ability to learn independently and as part of a group
- Manage time, work to deadlines and prioritise workloads
- Present results in a way that demonstrates that they have understood the technical and broader issues of derivative pricing and interest-rate modelling in continuous time

SYLLABUS

- Theory of Martingales in continuous time
- Brownian motion; definitions and properties
- Brownian motion as the limit of a binomial random-walk process
- Introduction to stochastic integration, stochastic differential equations and Ito’s formula
- Geometric Brownian motion; the Ornstein-Uhlenbeck process
- Introduction to Girsanov’s theorem and the martingale representation theorem
F70CF Continuous-Time Finance

- The Black-Scholes model
- Derivatives pricing using the Black-Scholes model using the martingale and PDE approaches to pricing
- Extensions to foreign currencies and dividend-paying stocks
- Portfolio risk management using the Greeks
- Introduction to interest rate models
- Introduction to credit risk models
